

GEOG 365

Introduction to GIS Programming

Instructor: Weiming Hu

Time: Tu Th 12:05 PM - 1:20 PM

Email: weiming@psu.edu

Place: 208 Walker Building

PennState

Outline

- Personal Introductions
- Course Introduction
- Syllabus

PennState

Personal Introductions

- 4th year Ph.D. candidate
- Computational Algorithm, Remote Sensing, GIScience, and HPC
- Guitar, low-cost devices

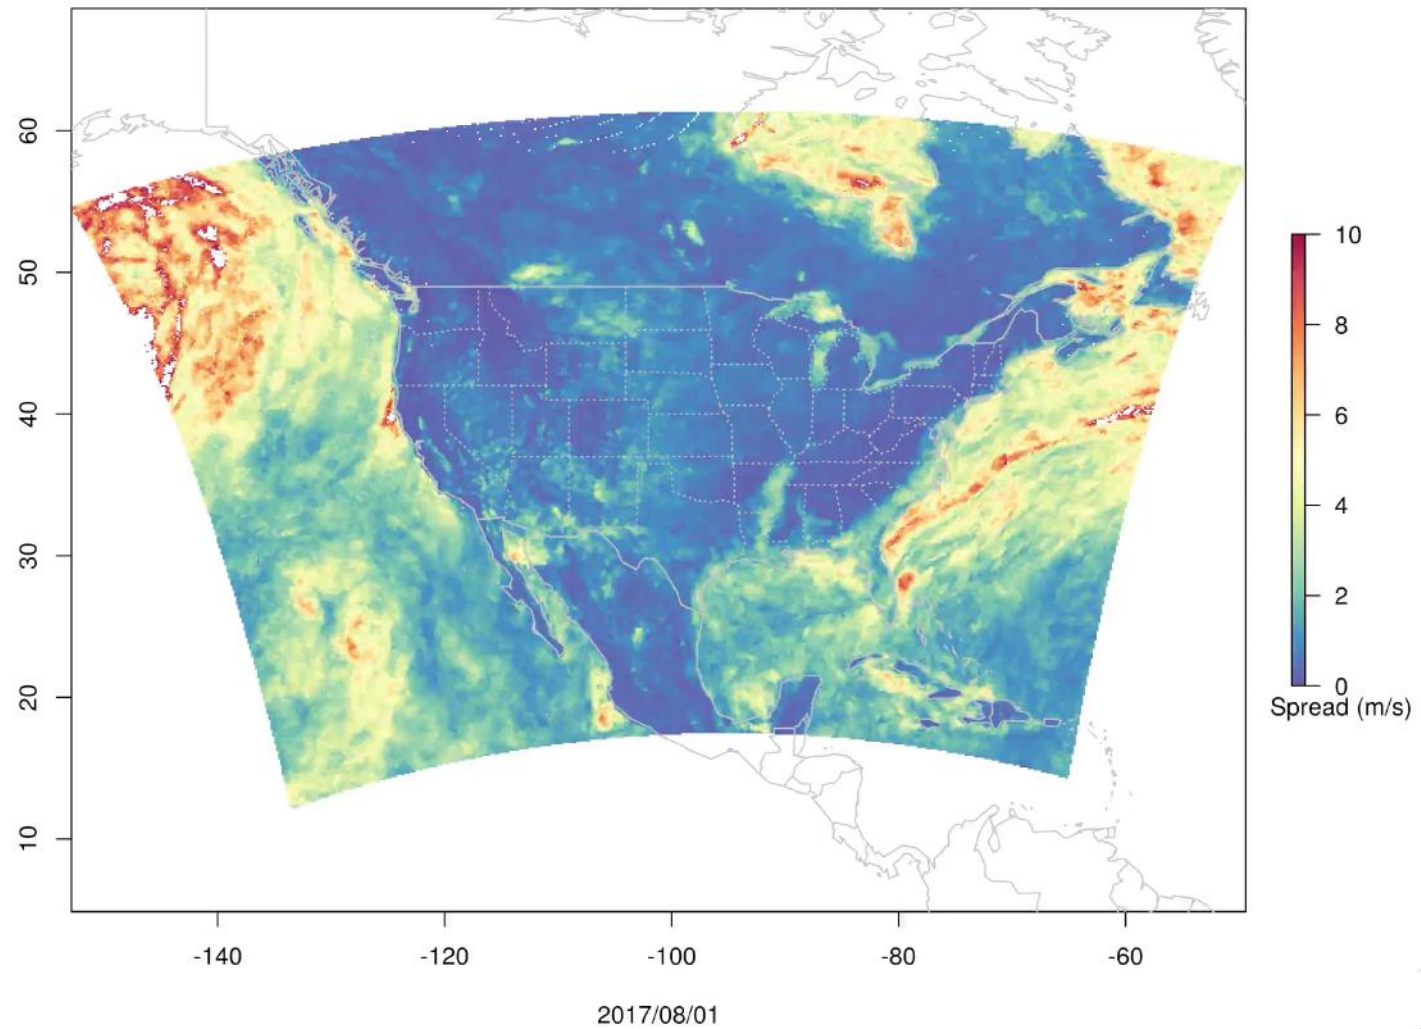

PennState

Personal Introductions

Wind speed ensemble prediction

- NCEP WRF-NAM and Analog Ensemble
- 11-km spatial resolution
- Daily forecasts with a 3-hour interval
- 1 year of ensemble forecasts for surface wind speed
- About 7,000 core hours on the supercomputer Cheyenne

Personal Introductions

Personal Introductions

- Parallel Analog Ensemble
 - <https://weiming-hu.github.io/AnalogEnsemble/>
- MoreParallelR
 - <https://weiming-hu.github.io/MoreParallelR/>

Personal Introductions

- Majors
- Expectations and interest
- Past experiences with GIS software
- Past experiences with R or any programming language

Course Introduction

What is GIS?

Geographic Information Systems (GISs) are computer assisted **systems** for the capture, storage, retrieval, analysis and display of spatial data.

Course Introduction

What is GIS?

- Geographic
 - Implies that locations of the data are known, or can be calculated, in terms of geographic coordinates;
- Information
 - Implies that data in a GIS are organized to yield useful knowledge, often as colored maps and images, but also as statistical graphics, tables, and various on-screen responses to interactive queries;
- System
 - Implies that a GIS is made up from several inter-related and linked components with different functions. Thus, GIS has functional capabilities for data capture, input, manipulation, transformation, visualization, combinations, query, analysis, modelling, and output.

What is missing?

Course Introduction

Problem 1: The missing New Zealand

The country that keeps getting left off maps, BBC,
<https://www.bbc.com/news/av/magazine-41905040/the-country-that-keeps-getting-left-off-maps>

Course Introduction

Problem 2: Data? Information? Knowledge?

PennState

Course Introduction

Problem 2: Data? Information? Knowledge?

Any real-world examples that follows the data-information-knowledge path?

Course Introduction

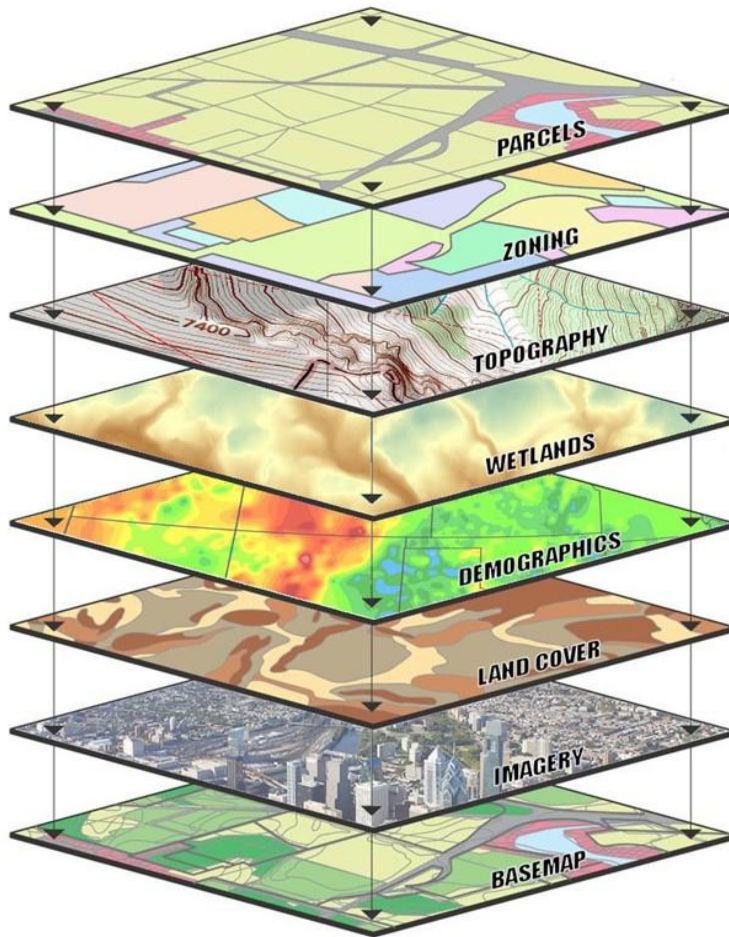

GIS components

PennState

Course Introduction

Data integration

GIS DATA LAYERS

Many different types of data can be integrated into a GIS and represented as a map layer.

Examples can include: streets, parcels, zoning, flood zones, client locations, competition, shopping centers, office parks, demographics, etc.

When these layers are drawn on top of one another, undetected spatial trends and relationships often emerge. This allows us to gain insight about relevant characteristics of a location.

Course Introduction

John Snow's Cholera Map

John Snow's well known cholera map is often cited as one of the earliest known examples of using geographic inquiry to understand a health epidemic. Starting on August 31, 1854, an outbreak of cholera hit the London district called Soho. Over the course of three days, 127 people died from the disease and by September 10, over 500 had died.

Physician John Snow was able to narrow down his suspicion of the source of the disease to a water pump on Broad Street. Snow mapped out the locations of the local water wells and cholera deaths to back his argument about the contaminated pump, convincing the local council to remove the handle to prevent its use.

Course Introduction

John Snow's Cholera Map

Contemporary critics:

- It was believed that bad airs originating from a 1665 plague burial site on which housing had been built and under which new sewers had been laid might be a source of cholera contagion;
- It was believed the sewers themselves, as independent conduits of foul odors generated by humane waste sites, might be complicit.

Course Introduction

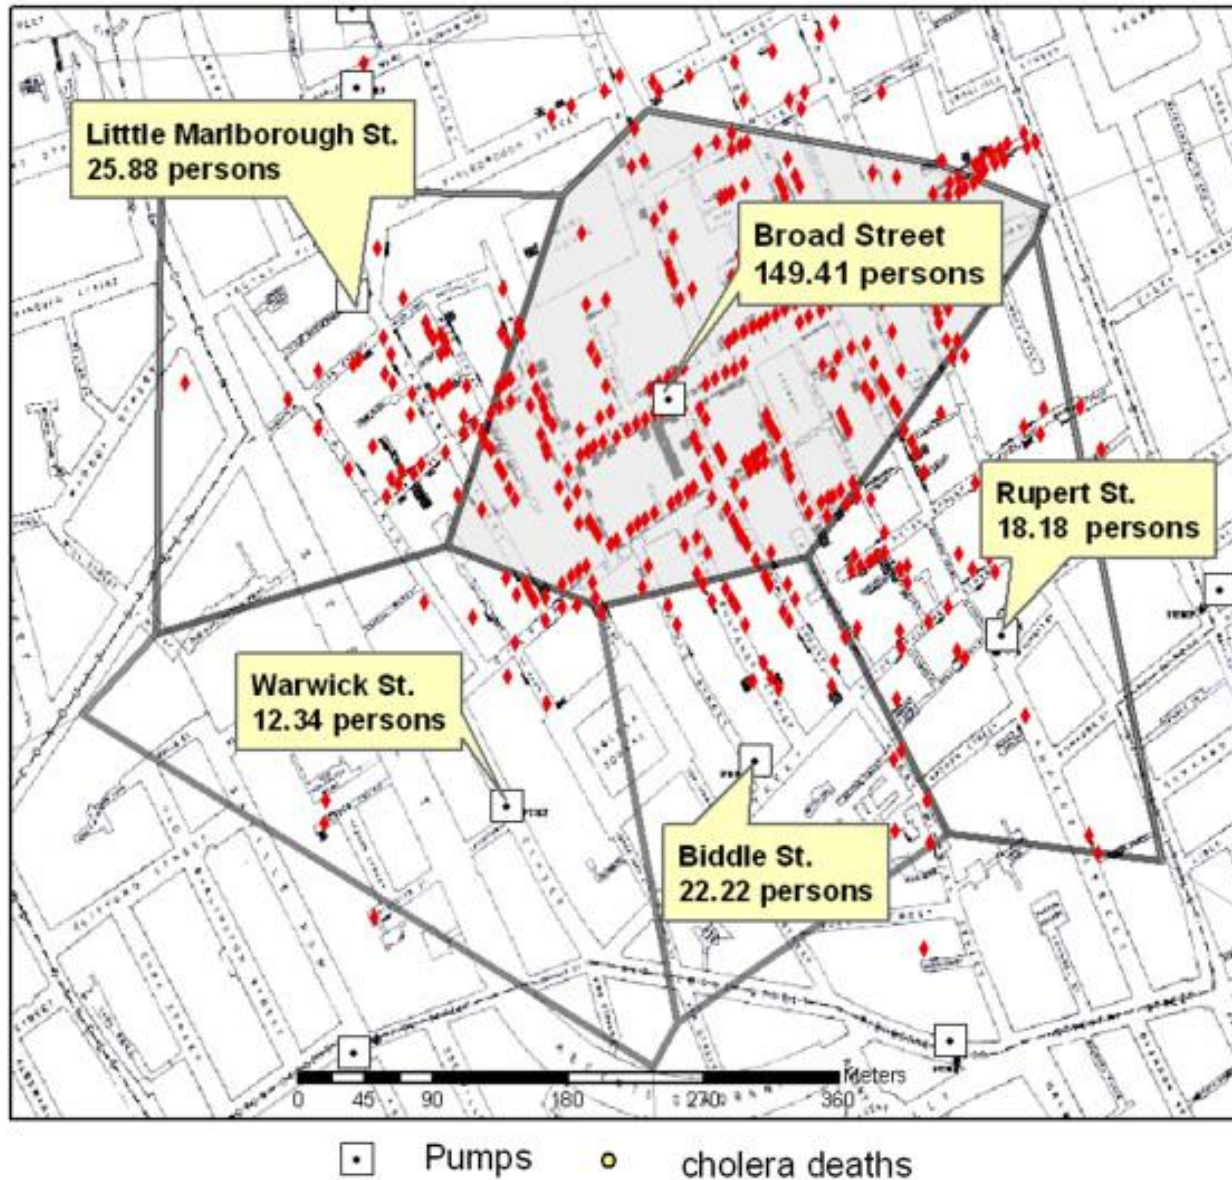

John Snow's Cholera Map

Can we do better with modern GIS?

- Overlay analysis
 - Analysis with the burial site and sewer line data shows lower mortality than the observed.
- Dirichlet tessellation and detailed quantification
 - 93.6% of all deaths mapped by Snow occurred in the central five water service areas.

Remaking Snow's 1855 Map

Cholera Mortality per 1,000 persons

Course Introduction

Why do we need programming when various GIS software exists?

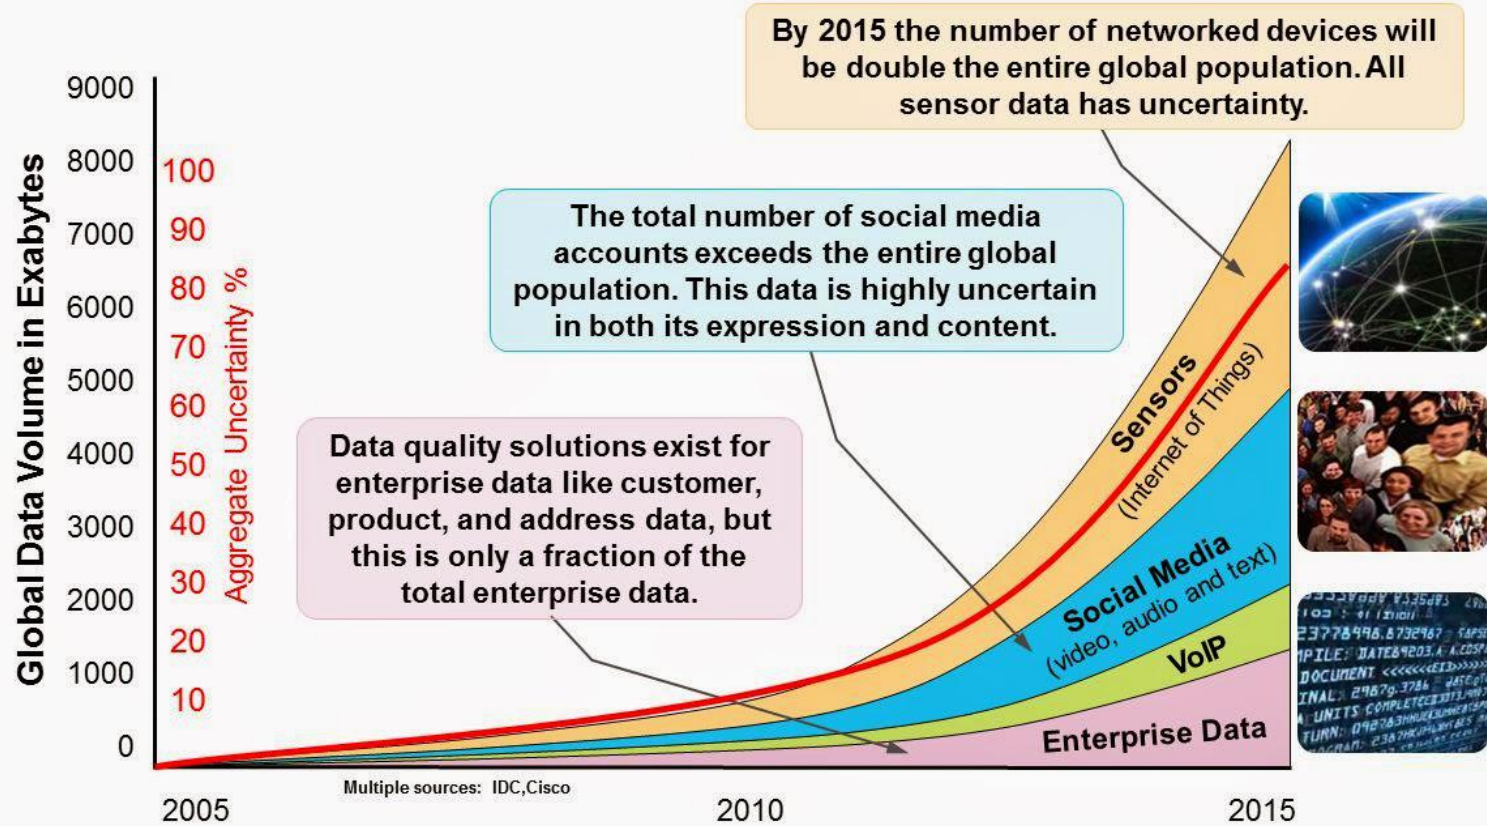

In John Snow's case, he was limited in data and efficient analytical tools.

In Tom Koch's case, "The counting and analysis for these calculations took about four days of on and off deskwork."

Can we do better?

Course Introduction

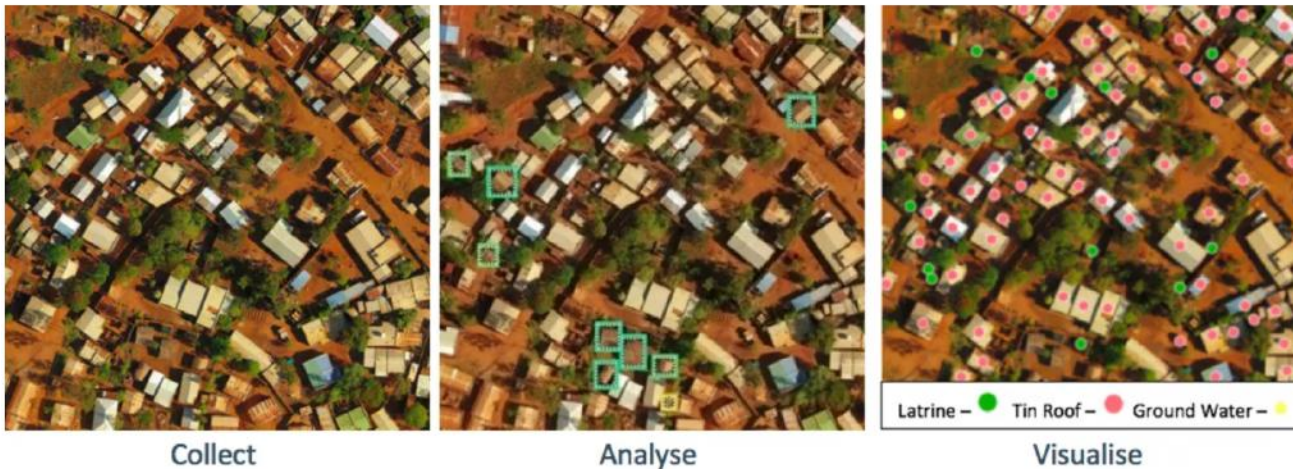

The exponential growth of data

Course Introduction

Automation means easier, faster, more accurate

PennState

Course Introduction

Automation means easier, faster, more accurate

PennState

Course Introduction

Why R?

- R is a multi-platform, open source language and environment for statistical computing and graphics;
- R has a rich collection of packages for geographic representation and analysis;
- Flexibility to other software and programming languages;

But,

- R is slow;
- R is memory-intensive;
- R code can be messy.
